

Demystifying AI Agents, By Building One

A 1-hour live-coding workshop

Ever wondered how AI agents work under the hood? In this session, we build one from scratch. No frameworks, no magic, just a small Java program that grows step by step into a working agent.

We start with a single HTTP call to an LLM and layer on capabilities one at a time until the bot can act on its own. By the end, you'll have a clear mental model of how agents are built and the intuition to make sense of the concepts you keep hearing about.

What you'll need: a laptop with Java 17+ and a free Gemini API key ([setup instructions](#) provided in advance).

What you'll leave with: the confidence that there's no magic, and that good engineering matters more than the model.
